Optical distance sensors

Measurement principle

The diffuse light reflected by the object is analysed using various measurement techniques. The results are used to determine the distance from the object to the sensor.

Features

- To a large extent, the measurement technique is independent of the colour and structure of the object
- Measurement of small object in the entire measurement range
- Up to 400 measurements per second
- Two different measurement techniques:
 1. Triangulation technique for measurement ranges between 20mm and 5000mm
 2. Phase measurement principle for measurement ranges up to 30,000mm

Ultrasonic distance sensors

Measurement principle

Ultrasonic distance sensors measure the propagation time of the ultrasonic waves which are reflected back to the sensor. The distance to the object is then calculated using this propagation time.

Features

- Detection of diffuse, transparent and shiny as well as solid, liquid or powdered objects
- Detection of objects with overhanging material
- Can be used at low measurement rates (typically 10 measurements per second)
- Not affected by dust, fog and smoke

Measurement principle

The transmitted light is spread into a parallel light band by means of a lens and received by the opposing CCD line. Interrupting this light band allows, for example, the edge of an object to be determined or the width of an object to be measured.

Products and typ. measurement ranges [mm]

GS 754
[0 25]

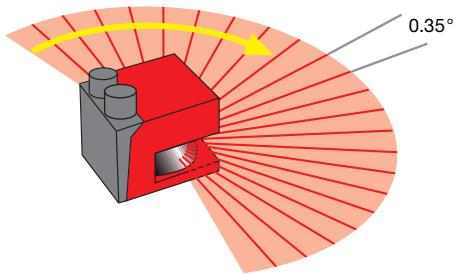

from page 240 onwards

Features

- Edge and object detection of up to 3 objects in 25 mm wide light band
- Minimum object diameter 0.5 mm
- Resolution 14 µm
- Analogue, digital and switching outputs
- Typical applications
 - Edge detection and height verification
 - Gap measurement with and without projecting edge
 - Position determination of punched holes
 - Detection of broken objects

Optical surface distance sensors

Measurement principle

The surface distance sensor scans its surroundings within a 190° arc by transmitting 529 laser beams per cycle. The distances to the objects located in the scanning range are determined using the pulse propagation time technique.

Products and typ. measurement ranges [mm]

ROD 4 / ROD 4plus

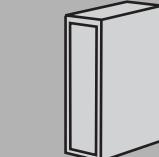

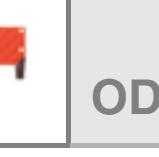

from page 244 onwards

[0 50000]

Features

- To a large extent, the measurement technique is independent of the colour and structure of the object
- Scanning angle 190°
- Scanning rate 25 scans per second
- Measurement value resolution 5 mm
- Typical applications
 - Collision prevention on driverless transportation systems
 - Projection monitoring
 - Fill-level monitoring of bulk materials
